

# 1°C Temperature Sensor with Hardware Thermal Shutdown

## PRODUCT FEATURES

Datasheet

### General Description

The EMC1423 and EMC1424 are high accuracy, low cost, System Management Bus (SMBus) temperature sensors. Advanced features such as Resistance Error Correction (REC), Beta Compensation (to support CPU diodes requiring the BJT/transistor model including 45nm, 65nm and 90nm processors) and automatic diode type detection combine to provide a robust solution for complex environmental monitoring applications.

Additionally, the EMC1423 and EMC1424 provide a hardware programmable system shutdown feature that is programmed at part power-up via two pull-up resistor values and that cannot be masked or corrupted through the SMBus.

Each device provides  $\pm 1^\circ$  accuracy for external diode temperatures and  $\pm 2^\circ$  accuracy for the internal diode temperature. The EMC1423 monitors three temperature channels (two external and one internal). The EMC1424 monitors four temperature channels (three external and one internal).

Resistance Error Correction automatically eliminates the temperature error caused by series resistance allowing greater flexibility in routing thermal diodes. Beta Compensation eliminates temperature errors caused by low, variable beta transistors common in today's fine geometry processors. The automatic beta detection feature monitors each external diode/transistor and determines the optimum sensor settings for accurate temperature measurements regardless of processor technology. This frees the user from providing unique sensor configurations for each temperature monitoring application. These advanced features plus  $\pm 1^\circ$ C measurement accuracy provide a low-cost, highly flexible and accurate solution for critical temperature monitoring applications.

### Applications

- Notebook Computers
- Desktop Computers
- Industrial
- Embedded applications

### Features

- Hardware Thermal Shutdown
  - triggers dedicated `SYS_SHDN` pin
  - hardware configured range  $77^\circ\text{C}$  to  $112^\circ\text{C}$  in  $1^\circ\text{C}$  steps
  - cannot be disabled or modified by software
- Support for diodes requiring the BJT/transistor model
  - supports 45nm, 65nm, and 90nm CPU thermal diodes.
- Automatically determines external diode type and optimal settings
- Resistance Error Correction
- External Temperature Monitors
  - $\pm 1^\circ\text{C}$  Accuracy ( $60^\circ\text{C} < T_{\text{DIODE}} < 100^\circ\text{C}$ )
  - $0.125^\circ\text{C}$  Resolution
  - Supports up to 2.2nF diode filter capacitor
  - Anti-parallel diodes for extra diode support
- Internal Temperature Monitor
  - $\pm 2^\circ\text{C}$  accuracy
- 3.3V Supply Voltage
- Programmable temperature limits for `ALERT`
- Available in Small 10-pin MSOP Lead-free RoHS Compliant Package

**Ordering Information:****EMC1423-1-AIZL-TR FOR 10-PIN, MSOP LEAD-FREE ROHS COMPLIANT PACKAGE****EMC1424-1-AIZL-TR FOR 10-PIN, MSOP LEAD-FREE ROHS COMPLIANT PACKAGE****Note:** See [Table 1.1, "Part Selection"](#) for SMBus addressing options.**REEL SIZE IS 4,000 PIECES.****This product meets the halogen maximum concentration values per IEC61249-2-21****For RoHS compliance and environmental information, please visit [www.smSC.com/rohs](http://www.smSC.com/rohs)***Please contact your SMSC sales representative for additional documentation related to this product such as application notes, anomaly sheets, and design guidelines.*

# Chapter 1 Block Diagram

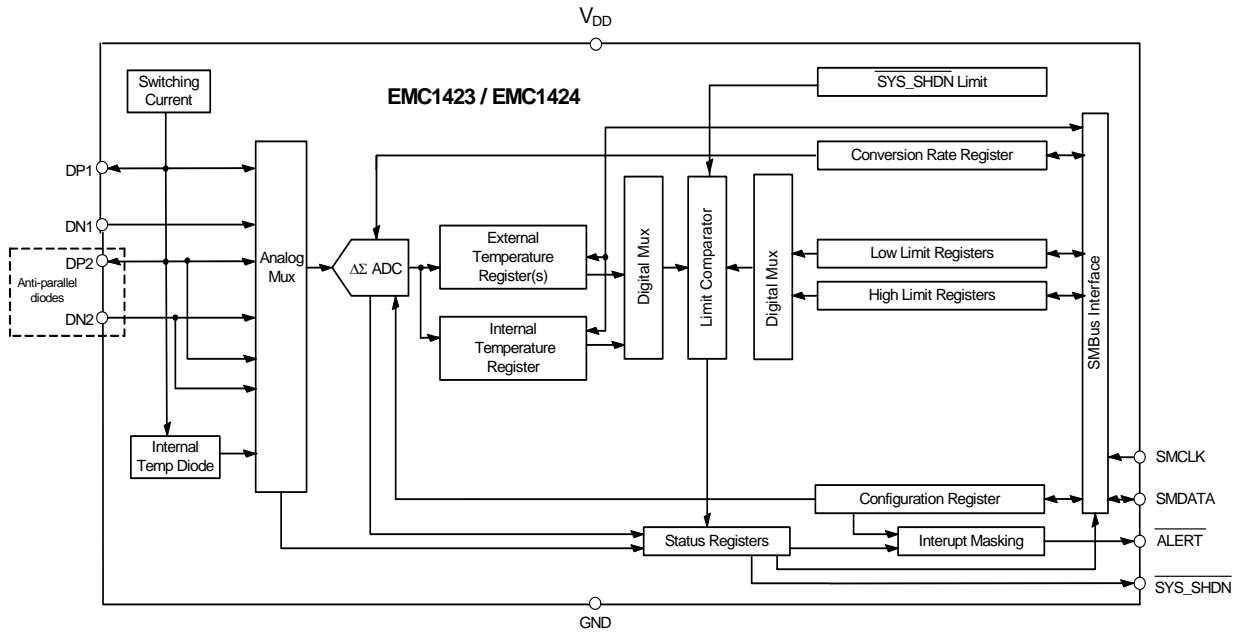

Figure 1.1 EMC1423/EMC1424 Block Diagram

## 1.1 Part Selection

The EMC1423 and EMC1424 device configuration is highlighted below.

Table 1.1 Part Selection

PART NUMBER	SMBUS ADDRESS	FUNCTIONALITY				PRODUCT ID
		EXTERNAL DIODES	DIODE 1 DEFAULT CONFIGURATION	DIODE 2 DEFAULT CONFIGURATION	OTHER	
EMC1423 - 1	100_1100b	2	Detect Diode w/ REC enabled	Detect Diode w/ REC enabled	Software programmable and maskable High Limits Software programmable and maskable SYS_SHDN Limits Hardware set SYS_SHDN Limit on External Diode 1	23h

**Table 1.1 Part Selection (continued)**

PART NUMBER	SMBUS ADDRESS	FUNCTIONALITY				PRODUCT ID
		EXTERNAL DIODES	DIODE 1 DEFAULT CONFIGURATION	DIODE 2 DEFAULT CONFIGURATION	OTHER	
EMC1424 - 1	100_1100b	3	Detect Diode w/ REC enabled	Fixed 2N3904 in anti-parallel diode configuration <a href="#">Note 1.1</a>	Software programmable and maskable High Limits  Software programmable and maskable <u>SYS_SHDN</u> Limits  Hardware set <u>SYS_SHDN</u> Limit on External Diode 1	27h

**Note 1.1** External 2 and external 3 channels have beta configuration hard wired to '0111b' and REC enabled.

## Chapter 2 Pin Description

Figure 2.1 EMC1423/EMC1424 Pin Diagram

Table 2.1 EMC1423 and EMC1424 Pin Description

PIN NUMBER	NAME	FUNCTION	TYPE
1	VDD	Power supply	Power
2	DP1	External diode 1 positive (anode) connection	AIO
3	DN1	External diode 1 negative (cathode) connection	AIO
4	DP2 / DN3	External diode 2 positive (anode) connection / External Diode 3 negative (cathode) connection for anti-parallel diodes	AIO
5	DN2/ DP3	External diode 2 negative (cathode) connection / External Diode 3 positive (anode) connection for anti-parallel diodes	AIO
6	GND	Ground	Power
7	$\overline{\text{SYS\_SHDN}}$	System Shutdown output signal - requires pull-up resistor which selects the Hardware Thermal Shutdown Limit	OD (5V)
8	$\overline{\text{ALERT}}$	Active low digital ALERT output signal - requires pull-up resistor	OD (5V)
9	SMDATA	SMBus Data input/output - requires pull-up resistor	DIOD (5V)
10	SMCLK	SMBus Clock input - requires pull-up resistor	DI (5V)

**APPLICATION NOTE:** For the 5V tolerant pins that have a pull-up resistor (SMCLK, SMDATA, SYS\_SHDN, and ALERT), the voltage difference between VDD and the pull-up voltage must never exceed 3.6V.

The pin types are described below:

Power - these pins are used to supply either VDD or GND to the device.

AIO - Analog Input / Output.

DI - Digital Input.

OD - Open Drain Digital Output.

DIOD - Digital Input / Open Drain Output.

## Chapter 3 Electrical Specifications

### 3.1 Absolute Maximum Ratings

Table 3.1 Absolute Maximum Ratings

DESCRIPTION	RATING	UNIT
Supply Voltage ( $V_{DD}$ )	-0.3 to 4.0	V
Voltage on 5V tolerant pins ( $V_{5VT\_pin}$ )	-0.3 to 5.5	V
Voltage on 5V tolerant pins ( $ V_{5VT\_pin} - V_{DD} $ ) (see <a href="#">Note 3.1</a> )	-0.3 to 3.6	V
Voltage on any other pin to Ground	-0.3 to $V_{DD} + 0.3$	V
Operating Temperature Range	-40 to +125	°C
Storage Temperature Range	-55 to +150	°C
Lead Temperature Range	Refer to JEDEC Spec. J-STD-020	
Package Thermal Characteristics for MSOP-10		
Thermal Resistance ( $\theta_{j-a}$ )	132.2	°C/W
ESD Rating, All pins HBM	2000	V

**Note:** Stresses at or above those listed could cause permanent damage to the device. This is a stress rating only and functional operation of the device at any other condition above those indicated in the operation sections of this specification is not implied. When powering this device from laboratory or system power supplies, it is important that the Absolute Maximum Ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when the AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. If this possibility exists, it is suggested that a clamp circuit be used.

**Note 3.1** For the 5V tolerant pins that have a pull-up resistor ( $\overline{SMCLK}$ ,  $\overline{SMDATA}$ ,  $\overline{SYS\_SHDN}$ , and  $\overline{ALERT}$ ), the pull-up voltage must not exceed 3.6V when the device is unpowered.

## 3.2 Electrical Specifications

**Table 3.2 Electrical Specifications**

V <sub>DD</sub> = 3.0V to 3.6V, T <sub>A</sub> = -40°C to 125°C, all typical values at T <sub>A</sub> = 27°C unless otherwise noted.							
CHARACTERISTIC	SYMBOL	MIN	TYP	MAX	UNITS	CONDITIONS	
DC Power							
Supply Voltage	V <sub>DD</sub>	3.0	3.3	3.6	V		
Supply Current	I <sub>DD</sub>		430	850	uA	1 conversion / sec, dynamic averaging disabled	
			930	1200	uA	4 conversions / sec, dynamic averaging enabled	
			1120		uA	≥ 16 conversions / sec, dynamic averaging enabled	
Internal Temperature Monitor							
Temperature Accuracy			±0.25	±1	°C	-5°C < T <sub>A</sub> < 100°C	
				±2	°C	-40°C < T <sub>A</sub> < 125°C	
Temperature Resolution			0.125		°C		
External Temperature Monitor							
Temperature Accuracy			±0.25	±1	°C	+20°C < T <sub>DIODE</sub> < +110°C 0°C < T <sub>A</sub> < 100°C	
			±0.5	±2	°C	-40°C < T <sub>DIODE</sub> < 127°C	
Temperature Resolution			0.125		°C		
		t <sub>CONV</sub>		190		ms	EMC1423, default settings
		t <sub>CONV</sub>		150		ms	EMC1424, default settings
Capacitive Filter	C <sub>FILTER</sub>		2.2	2.5	nF	Connected across external diode	
ALERT and SYS_SHDN pins							
Output Low Voltage	V <sub>OL</sub>	0.4			V	I <sub>SINK</sub> = 8mA	
Leakage Current	I <sub>LEAK</sub>			±5	uA	ALERT and SYS_SHDN pins Device powered or unpowered T <sub>A</sub> < 85°C pull-up voltage ≤ 3.6V	
Power up time				15	ms	Temp selection read <a href="#">Note 3.2</a>	

**Note 3.2** During the power up time, SMBus communication is permitted, however the SYS\_SHDN and ALERT pins must not be pulled low.

### 3.3 SMBus Electrical Characteristics

**Table 3.3 SMBus Electrical Specifications**

V <sub>DD</sub> = 3.0V to 3.6V, T <sub>A</sub> = -40°C to 125°C, all typical values are at T <sub>A</sub> = 27°C unless otherwise noted.						
CHARACTERISTIC	SYMBOL	MIN	TYP	MAX	UNITS	CONDITIONS
SMBus Interface						
Input High Voltage	V <sub>IH</sub>	2.0		V <sub>DD</sub>	V	5V Tolerant
Input Low Voltage	V <sub>IL</sub>	-0.3		0.8	V	5V Tolerant
Input High/Low Current	I <sub>IH</sub> / I <sub>IL</sub>			±5	uA	Powered or unpowered T <sub>A</sub> < 85°C
Hysteresis			420		mV	
Input Capacitance	C <sub>IN</sub>		5		pF	
Output Low Sink Current	I <sub>OL</sub>	8.2		15	mA	SMDATA = 0.4V
SMBus Timing						
Clock Frequency	f <sub>SMB</sub>	10		400	kHz	
Spike Suppression	t <sub>SP</sub>			50	ns	
Bus free time Start to Stop	t <sub>BUF</sub>	1.3			us	
Hold Time: Start	t <sub>HD:STA</sub>	0.6			us	
Setup Time: Start	t <sub>SU:STA</sub>	0.6			us	
Setup Time: Stop	t <sub>SU:STP</sub>	0.6			us	
Data Hold Time	t <sub>HD:DAT</sub>	0			us	When transmitting to the master
Data Hold Time	t <sub>HD:DAT</sub>	0.3			us	When receiving from the master
Data Setup Time	t <sub>SU:DAT</sub>	100			ns	
Clock Low Period	t <sub>LOW</sub>	1.3			us	
Clock High Period	t <sub>HIGH</sub>	0.6			us	
Clock/Data Fall time	t <sub>FALL</sub>			300	ns	Min = 20+0.1C <sub>LOAD</sub> ns
Clock/Data Rise time	t <sub>RISE</sub>			300	ns	Min = 20+0.1C <sub>LOAD</sub> ns
Capacitive Load	C <sub>LOAD</sub>			400	pF	per bus line

## Chapter 4 System Management Bus Interface Protocol

### 4.1 System Management Bus Interface Protocol

The EMC1423 and EMC1424 communicate with a host controller, such as an SMSC SIO, through the SMBus. The SMBus is a two-wire serial communication protocol between a computer host and its peripheral devices. A detailed timing diagram is shown in [Figure 4.1](#).

For the first 15ms after power-up the device may not respond to SMBus communications.

Figure 4.1 SMBus Timing Diagram

The EMC1423 and EMC1424 are SMBus 2.0 compatible and support Send Byte, Read Byte, Write Byte, Receive Byte, and the Alert Response Address as valid protocols as shown below.

All of the below protocols use the convention in [Table 4.1](#).

Table 4.1 Protocol Format

DATA SENT TO DEVICE	DATA SENT TO THE HOST
# of bits sent	# of bits sent

Attempting to communicate with the EMC1423 and EMC1424 SMBus interface with an invalid slave address or invalid protocol will result in no response from the device and will not affect its register contents. Stretching of the SMCLK signal is supported, provided other devices on the SMBus control the timing.

## 4.2 Write Byte

The Write Byte is used to write one byte of data to the registers as shown below [Table 4.2](#):

**Table 4.2 Write Byte Protocol**

START	SLAVE ADDRESS	WR	ACK	REGISTER ADDRESS	ACK	REGISTER DATA	ACK	STOP
1 -> 0	1001_100	0	0	XXh	0	XXh	0	0 -> 1

## 4.3 Read Byte

The Read Byte protocol is used to read one byte of data from the registers as shown in [Table 4.3](#).

**Table 4.3 Read Byte Protocol**

START	SLAVE ADDRESS	WR	ACK	REGISTER ADDRESS	ACK	START	SLAVE ADDRESS	RD	ACK	REGISTER DATA	NACK	STOP
1 -> 0	1001_100	0	1	XXh	0	1 -> 0	1001_100	1	1	XX	1	0 -> 1

## 4.4 Send Byte

The Send Byte protocol is used to set the internal address register pointer to the correct address location. No data is transferred during the Send Byte protocol as shown in [Table 4.4](#).

**Table 4.4 Send Byte Protocol**

START	SLAVE ADDRESS	WR	ACK	REGISTER ADDRESS	ACK	STOP
1 -> 0	1001_100	0	0	XXh	0	0 -> 1

## 4.5 Receive Byte

The Receive Byte protocol is used to read data from a register when the internal register address pointer is known to be at the right location (e.g. set via Send Byte). This is used for consecutive reads of the same register as shown in [Table 4.5](#).

**Table 4.5 Receive Byte Protocol**

START	SLAVE ADDRESS	RD	ACK	REGISTER DATA	NACK	STOP
1 -> 0	1001_100	1	0	XXh	1	0 -> 1

## 4.6 Alert Response Address

The  $\overline{\text{ALERT}}$  output can be used as a processor interrupt or as an SMBus Alert.

When it detects that the  $\overline{\text{ALERT}}$  pin is asserted, the host will send the Alert Response Address (ARA) to the general address of 0001\_100xb. All devices with active interrupts will respond with their client address as shown in [Table 4.6](#).

**Table 4.6 Alert Response Address Protocol**

START	ALERT RESPONSE ADDRESS	RD	ACK	DEVICE ADDRESS	NACK	STOP
1 -> 0	0001_100	1	0	1001_1000	1	0 -> 1

The EMC1423 and EMC1424 will respond to the ARA in the following way:

1. Send Slave Address and verify that full slave address was sent (i.e. the SMBus communication from the device was not prematurely stopped due to a bus contention event).
2. Set the MASK bit to clear the  $\overline{\text{ALERT}}$  pin.

**APPLICATION NOTE:** The ARA does not clear the Status Register and if the MASK bit is cleared prior to the Status Register being cleared, the  $\overline{\text{ALERT}}$  pin will be reasserted.

## 4.7 SMBus Address

The EMC1423 and EMC1424 respond to hard-wired SMBus slave address as shown in [Table 1.1](#).

**Note:** Other addresses are available. Contact SMSC for more information.

## 4.8 SMBus Timeout

The EMC1423 and EMC1424 support SMBus Timeout. If the clock line is held low for longer than 30ms, the device will reset its SMBus protocol. This function can be enabled by setting the TIMEOUT bit in the Consecutive Alert Register (see [Section 6.13](#)).

## Chapter 5 Product Description

The EMC1423 and EMC1424 are SMBus temperature sensors with Hardware Thermal Shutdown. The EMC1423 monitors one internal diode and two externally connected temperature diodes. The EMC1424 monitors one internal diode and three externally connected temperature diodes.

Thermal management is performed in cooperation with a host device. This consists of the host reading the temperature data of both the external and internal temperature diodes of the EMC1423 and EMC1424 and using that data to control the speed of one or more fans.

The EMC1423 and EMC1424 have two levels of monitoring. The first provides a maskable ALERT signal to the host when measured temperatures meet or exceed user programmable limits. This allows the EMC1423 or EMC1424 to be used as an independent thermal watchdog to warn the host of temperature hot spots without direct control by the host.

The second level of monitoring asserts the SYS\_SHDN pin when the External Diode 1 temperature exceeds a hardware specified threshold temperature. Additionally, the internal diode and External Diode 2, and External Diode 3 (EMC1424 only) can be configured to assert the SYS\_SHDN pin when the measured temperature exceeds user programmable limits.

Since the EMC1423 and EMC1424 automatically correct for temperature errors due to series resistance in temperature diode lines, there is greater flexibility in where external diodes are positioned and better measurement accuracy than previously available with non-resistance error correcting devices. The automatic beta detection feature means that there is no need to program the device according to which type of diode is present on the External Diode 1 channel. This also includes CPU diodes that require the transistor or BJT model for monitoring their temperature. Therefore, the EMC1423/EMC1424 can power up ready to operate for any system configuration.

For the EMC1424, External Diode channels 2 and 3 are only compatible with general purpose diodes (such as a 2N3904).

Figure 5.1 shows a system level block diagram of the EMC1423. Figure 5.2 shows a system level block diagram of the EMC1424.

Figure 5.1 System Diagram for EMC1423

**Figure 5.2 System Diagram for EMC1424**

### 5.0.1 Conversion Rates

The EMC1423 and EMC1424 may be configured for different conversion rates based on the system requirements. The conversion rate is configured as described in [Section 6.5](#). The default conversion rate is 4 conversions per second. Other available conversion rates are shown in [Table 6.6](#).

### 5.0.2 Dynamic Averaging

Dynamic averaging causes the EMC1423 and EMC1424 to measure the external diode channels for an extended time based on the selected conversion rate. This functionality can be disabled for increased power savings at the lower conversion rates (see [Section 6.4](#)). When dynamic averaging is enabled, the device will automatically adjust the sampling and measurement time for the external diode channels. This allows the device to average 2x or 16x longer than the normal 11 bit operation (nominally 21ms per channel) while still maintaining the selected conversion rate. The benefits of dynamic averaging are improved noise rejection due to the longer integration time as well as less random variation of the temperature measurement.

When enabled, the dynamic averaging will affect the average supply current based on the chosen conversion rate as shown in [Table 5.1](#) for EMC1423.

**Table 5.1 Supply Current vs. Conversion Rate for EMC1423**

CONVERSION RATE	AVERAGE SUPPLY CURRENT		AVERAGING FACTOR (BASED ON 11-BIT OPERATION)	
	ENABLED (DEFAULT)	DISABLED	ENABLED (DEFAULT)	DISABLED
1 / sec	660uA	430uA	16x	1x
2 / sec	930uA	475uA	8x	1x
4 / sec (default)	950uA	510uA	4x	1x
8 / sec	1010uA	630uA	2x	1x
16 / sec	1020uA	775uA	1x	1x

**Table 5.1 Supply Current vs. Conversion Rate for EMC1423 (continued)**

CONVERSION RATE	AVERAGE SUPPLY CURRENT		AVERAGING FACTOR (BASED ON 11-BIT OPERATION)	
	ENABLED (DEFAULT)	DISABLED	ENABLED (DEFAULT)	DISABLED
32 / sec	1050uA	1050uA	0.5x	0.5x
64 / sec	1100uA	1100uA	0.25x	0.25x

When enabled, the dynamic averaging will affect the average supply current based on the chosen conversion rate as shown in [Table 5.2](#) for EMC1424.

**Table 5.2 Supply Current vs. Conversion Rate for EMC1424**

CONVERSION RATE	AVERAGE SUPPLY CURRENT		AVERAGING FACTOR (BASED ON 11-BIT OPERATION)	
	ENABLED (DEFAULT)	DISABLED	ENABLED (DEFAULT)	DISABLED
1 / sec	660uA	430uA	8x	1x
2 / sec	930uA	475uA	4x	1x
4 / sec (default)	950uA	510uA	2x	1x
8 / sec	1010uA	630uA	1x	1x
16 / sec	1020uA	775uA	0.5x	0.5x
32 / sec	1050uA	1050uA	0.25x	0.25x
64 / sec	1100uA	1100uA	0.125x	0.125x

## 5.1 SYS\_SHDN Output

The SYS\_SHDN output is asserted independently of the ALERT output and cannot be masked. If the External Diode 1 temperature exceeds the Hardware Thermal Shutdown Limit for the programmed number of consecutive measurements, then the SYS\_SHDN pin is asserted.

The Hardware Thermal Shutdown Limit is defined at power-up via the pull-up resistors on the SYS\_SHDN and ALERT pins as shown in [Table 5.3](#). This limit cannot be modified or masked via software.

In addition to External Diode 1 channel triggering the SYS\_SHDN pin when the measured temperature exceeds to the Hardware Thermal Shutdown Limit, each of the measurement channels can be configured to assert the SYS\_SHDN pin when they exceed the corresponding THERM Limit.

When the SYS\_SHDN pin is asserted, it will not release until the External Diode 1 temperature drops below the Hardware Thermal Shutdown Limit minus 10°C and all other measured temperatures drop below the THERM Limit minus the THERM Hysteresis value (when linked to SYS\_SHDN).

[Figure 5.3](#) shows a block diagram of the interaction between the input channels and the SYS\_SHDN pin.

Figure 5.3 Block Diagram of Hardware Thermal Shutdown

## 5.2 Hardware Thermal Shutdown Limit

The Hardware Thermal Shutdown Limit temperature is determined by pull-up resistors on the `SYS_SHDN` and `ALERT` pins shown in [Table 5.3](#).

 Table 5.3 `SYS_SHDN` Threshold Temperature

<code>SYS_SHDN</code> PULL-UP  <code>ALERT</code> PULL-UP	4.7K OHM ±10%	6.8K OHM ±10%	10K OHM ±10%	15K OHM ±10%	22K OHM ±10%	33K OHM ±10%
4.7K OHM ±10%	77°C	83°C	89°C	95°C	101°C	107°C
6.8K OHM ±10%	78°C	84°C	90°C	96°C	102°C	108°C
10K OHM ±10%	79°C	85°C	91°C	97°C	103°C	109°C
15K OHM ±10%	80°C	86°C	92°C	98°C	104°C	110°C
22K OHM ±10%	81°C	87°C	93°C	99°C	105°C	111°C
33K OHM ±10%	82°C	88°C	94°C	100°C	106°C	112°C

## 5.3 **ALERT Output**

The  $\overline{\text{ALERT}}$  pin is an open drain output and requires a pull-up resistor to  $V_{DD}$  and has two modes of operation: interrupt mode and comparator Mode. The mode of the  $\overline{\text{ALERT}}$  output is selected via the  $\overline{\text{ALERT}} / \text{COMP}$  bit in the Configuration Register (see [Section 6.4](#)).

### 5.3.1 **ALERT Pin Interrupt Mode**

When configured to operate in interrupt mode, the  $\overline{\text{ALERT}}$  pin asserts low when an out of limit measurement ( $\geq$  high limit or  $<$  low limit) is detected on any diode or when a diode fault is detected. The  $\overline{\text{ALERT}}$  pin will remain asserted as long as an out-of-limit condition remains. Once the out-of-limit condition has been removed, the  $\overline{\text{ALERT}}$  pin will remain asserted until the appropriate status bits are cleared.

The  $\overline{\text{ALERT}}$  pin can be masked by setting the MASK bit. Once the  $\overline{\text{ALERT}}$  pin has been masked, it will be de-asserted and remain de-asserted until the MASK bit is cleared by the user. Any interrupt conditions that occur while the  $\overline{\text{ALERT}}$  pin is masked will update the Status Register normally.

The  $\overline{\text{ALERT}}$  pin is used as an interrupt signal or as an Smbus Alert signal that allows an SMBus slave to communicate an error condition to the master. One or more  $\overline{\text{ALERT}}$  outputs can be hard-wired together.

### 5.3.2 **ALERT Pin Comparator Mode**

When the  $\overline{\text{ALERT}}$  pin is configured to operate in comparator mode it will be asserted if any of the measured temperatures exceeds the respective high limit. The  $\overline{\text{ALERT}}$  pin will remain asserted until all temperatures drop below the corresponding high limit minus the THERM Hysteresis value.

When the  $\overline{\text{ALERT}}$  pin is asserted in comparator mode, the corresponding high limit status bits will be set. Reading these bits will not clear them until the  $\overline{\text{ALERT}}$  pin is deasserted. Once the  $\overline{\text{ALERT}}$  pin is deasserted, the status bits will be automatically cleared.

The MASK bit will not block the  $\overline{\text{ALERT}}$  pin in this mode, however the individual channel masks (see [Section 6.12](#)) will prevent the respective channel from asserting the  $\overline{\text{ALERT}}$  pin.

## 5.4 **ALERT and SYS\_SHDN Pin Considerations**

Because of the decode method used to determine the Hardware Thermal Shutdown Limit, it is important that the pull-up resistance on both the  $\overline{\text{ALERT}}$  and  $\overline{\text{SYS\_SHDN}}$  pins be within the tolerances shown in [Table 5.3](#). Additionally, the pull-up resistor on the  $\overline{\text{ALERT}}$  and  $\overline{\text{SYS\_SHDN}}$  pins must be connected to the same 3.3V supply that drives the VDD pin.

For 15ms after power up, the  $\overline{\text{ALERT}}$  and  $\overline{\text{SYS\_SHDN}}$  pins must not be pulled low or the Hardware Thermal Shutdown Limit will not be decoded properly. If the system requirements do not permit these conditions, then the  $\overline{\text{ALERT}}$  and  $\overline{\text{SYS\_SHDN}}$  pins must be isolated from their respective busses during this time.

One method of isolating this pin is shown in [Figure 5.4](#).

Figure 5.4 Isolating ALERT and SYS\_SHDN Pins

## 5.5 Beta Compensation

The EMC1423 and EMC1424 are configured to monitor the temperature of basic diodes (e.g. 2N3904), or CPU thermal diodes. It automatically detects the type of external diode (CPU diode or diode connected transistor) and determines the optimal setting to reduce temperature errors introduced by beta variation in beta for two forced emitter currents with a transistor whose ideal beta is 50 would contribute approximately 0.25°C error at 100°C. However for substrate transistors where the base-emitter junction is used for temperature measurement and the collector is tied to the substrate, the proportional beta variation will cause large error. For example, a 10% variation in beta for two forced emitter currents with a transistor whose ideal beta is 0.5 would contribute approximately 8.25°C error at 100°C.

For discrete transistors configured with the collector and base shorted together, the beta is generally sufficiently high such that the percent change in beta variation is very small. For example, a 10% variation in beta for two forced emitter currents with a transistor whose ideal beta is 50 would contribute approximately 0.25°C error at 100°C. However for substrate transistors where the base-emitter junction is used for temperature measurement and the collector is tied to the substrate, the proportional beta variation will cause large error. For example, a 10% variation in beta for two forced emitter currents with a transistor whose ideal beta is 0.5 would contribute approximately 8.25°C error at 100°C.

The External Diode 2 and External Diode 3 channels do not support Beta Compensation.

## 5.6 Resistance Error Correction (REC)

Parasitic resistance in series with the external diodes will limit the accuracy obtainable from temperature measurement devices. The voltage developed across this resistance by the switching diode currents cause the temperature measurement to read higher than the true temperature. Contributors to series resistance are PCB trace resistance, on die (i.e. on the processor) metal resistance, bulk resistance in the base and emitter of the temperature transistor. Typically, the error caused by series resistance is +0.7°C per ohm. The EMC1423 and EMC1424 automatically correct up to 100 ohms of series resistance.

## 5.7 Programmable External Diode Ideality Factor

The EMC1423 and EMC1424 do not support a programmable Ideality Factor for the External Diode 1 channel. It is hard-wired for an ideality factor of 1.008.

The EMC1423 External Diode 2 channel defaults to measuring external diodes with an ideality factor of 1.008. Likewise, the EMC1424 External Diode 2 and 3 channels default to measuring external diodes with an ideality factor of 1.008.

Not all external diodes, processor or discrete, will have this exact value. This variation of the ideality factor introduces error in the temperature measurement which must be corrected for. This correction is typically done using programmable offset registers. Since an ideality factor mismatch introduces an error that is a function of temperature, this correction is only accurate within a small range of temperatures. To provide maximum flexibility to the user, the EMC1423 and EMC1424 provides a 6-

bit register for the External Diode 2 channel (and External Diode 3 channel for the EMC1424) where the ideality factor of the diode can be programmed to eliminate errors across all temperatures.

**APPLICATION NOTE:** When monitoring a substrate transistor or CPU diode and beta compensation is enabled, the Ideality Factor should not be adjusted. Beta Compensation automatically corrects for most ideality errors.

## 5.8 Diode Faults

The EMC1423 and EMC1424 detect an open on the DP and DN pins, and a short across the DP and DN pins. For each temperature measurement made, the device checks for a diode fault on the external diode channel(s). When a diode fault is detected, the ALERT pin asserts (unless masked, see [Section 5.9](#)) and the temperature data reads 00h in the MSB and LSB registers (note: the low limit will not be checked). A diode fault is defined as one of the following: an open between DP and DN, a short from  $V_{DD}$  to DP, or a short from  $V_{DD}$  to DN.

If a short occurs across DP and DN or a short occurs from DP to GND, the low limit status bit is set and the ALERT pin asserts (unless masked). This condition is indistinguishable from a temperature measurement of 0.000degC (-64°C in extended range) resulting in temperature data of 00h in the MSB and LSB registers.

If a short from DN to GND occurs (with a diode connected), temperature measurements will continue as normal with no alerts.

## 5.9 Consecutive Alerts

The EMC1423 and EMC1424 contain multiple consecutive alert counters. One set of counters applies to the ALERT pin and the second set of counters applies to the SYS\_SHDN pin. Each temperature measurement channel has a separate consecutive alert counter for each of the ALERT and SYS\_SHDN pins. All counters are user programmable and determine the number of consecutive measurements that a temperature channel(s) must be out-of-limit or reporting a diode fault before the corresponding pin is asserted.

See [Section 6.13](#) for more details on the consecutive alert function.

## 5.10 Digital Filter

To reduce the effect of noise and temperature spikes on the reported temperature, the External Diode 1 channel uses a programmable digital filter. This filter can be configured as Level 1, Level 2, or Disabled. The typical filter performance is shown in [Figure 5.5](#) and [Figure 5.6](#).

Figure 5.5 Temperature Filter Step Response

Figure 5.6 Temperature Filter Impulse Response

## 5.11 Temperature Monitors

In general, thermal diode temperature measurements are based on the change in forward bias voltage of a diode when operated at two different currents. This  $\Delta V_{BE}$  is proportional to absolute temperature as shown in the following equation:

$$\Delta V_{BE} = \frac{\eta kT}{q} \ln \left( \frac{I_{HIGH}}{I_{LOW}} \right)$$

where:

$k$  = Boltzmann's constant

$T$  = absolute temperature in Kelvin [1]

$q$  = electron charge

$\eta$  = diode ideality factor

Figure 5.7 shows a block diagram of the temperature measurement circuit. The negative terminal for the remote temperature diode, DN, is internally biased with a forward diode voltage referenced to ground.

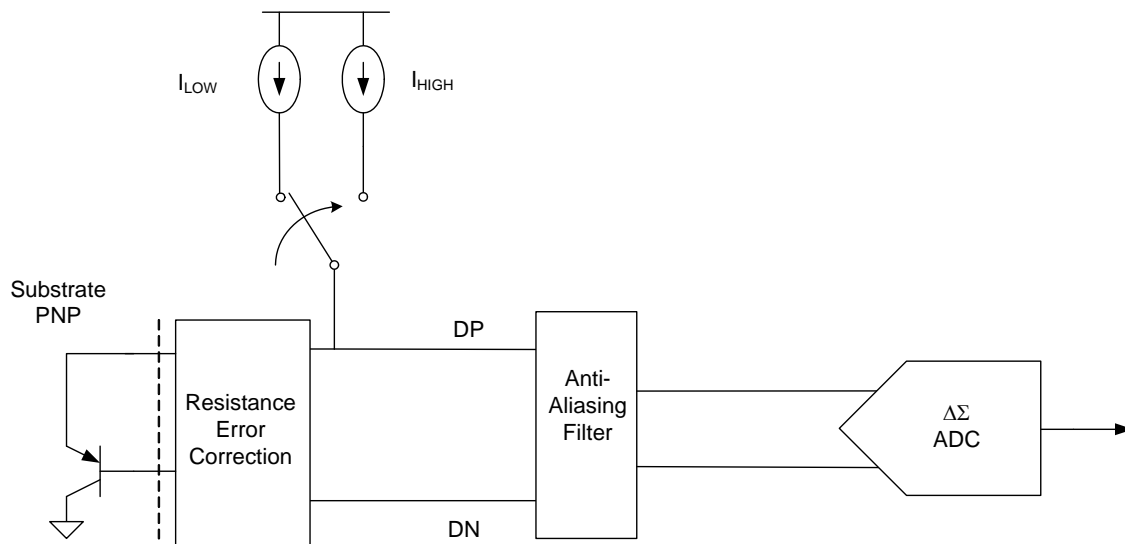

Figure 5.7 Block Diagram of Temperature Monitoring Circuit

## 5.12 Temperature Measurement Results and Data

The temperature measurement results are stored in the internal and external temperature registers. These are then compared with the values stored in the high and low limit registers. Both external and internal temperature measurements are stored in 11-bit format with the eight (8) most significant bits stored in a high byte register and the three (3) least significant bits stored in the three (3) MSB positions of the low byte register. All other bits of the low byte register are set to zero.

The EMC1423 and EMC1424 have two selectable temperature ranges. The default range is from 0°C to +127°C and the temperature is represented as binary number able to report a temperature from 0°C to +127.875°C in 0.125°C steps.

The extended range is an extended temperature range from -64°C to +191°C. The data format is a binary number offset by 64°C. The extended range is used to measure temperature diodes with a large known offset (such as AMD processor diodes) where the diode temperature plus the offset would be equivalent to a temperature higher than +127°C.

Table 5.4 shows the default and extended range formats.

**Table 5.4 Temperature Data Format**

TEMPERATURE (°C)	DEFAULT RANGE 0°C TO 127°C	EXTENDED RANGE -64°C TO 191°C
Diode Fault	000 0000 0000	000 0000 0000
-64	000 0000 0000	000 0000 0000 <a href="#">Note 5.2</a>
-1	000 0000 0000	001 1111 1000
0	000 0000 0000 <a href="#">Note 5.1</a>	010 0000 0000
0.125	000 0000 0001	010 0000 0001
1	000 0000 1000	010 0000 1000
64	010 0000 0000	100 0000 0000
65	010 0000 1000	100 0000 1000
127	011 1111 1000	101 1111 1000
127.875	011 1111 1111	101 1111 1111
128	011 1111 1111 <a href="#">Note 5.3</a>	110 0000 0000
190	011 1111 1111	111 1111 0000
191	011 1111 1111	111 1111 1000
>= 191.875	011 1111 1111	111 1111 1111 <a href="#">Note 5.4</a>

**Note 5.1** In default mode, all temperatures < 0°C will be reported as 0°C.

**Note 5.2** In the extended range, all temperatures < -64°C will be reported as -64°C.

**Note 5.3** For the default range, all temperatures > +127.875°C will be reported as +127.875°C.

**Note 5.4** For the extended range, all temperatures > +191.875°C will be reported as +191.875°C.

## 5.13 Anti-parallel Diode Connections

The EMC1424 supports reading two external diodes on the same set of pins (DP2, DN2). These diodes are connected as shown in [Figure 5.2](#). Due to the anti-parallel connection of these diodes, both diodes will be reverse biased by a  $V_{BE}$  voltage (approximately 0.7V). Because of this reverse bias, only discrete thermal diodes (such as a 2N3904) are recommended to be placed on these pins.

## 5.14 External Diode Connections

The EMC1423 is hard-wired to measure a specific type of thermal diode on the External Diode 1 channel only (DP1 and DN1 pins). The External Diode 2 channel can be configured to measure a CPU substrate transistor, a discrete thermal diode such as a 2N3904, or an AMD processor diode. The supported configurations for the external diode channels are shown in [Figure 5.8](#).

The EMC1424 is hard-wired to measure a specific type of thermal diode on the External Diode 1 channel only (DP1 and DN1 pins). The External Diode 2 and External Diode 3 channel are configured to measure a pair of discrete anti-parallel diodes (shared on pins DP2 and DN2). The supported configurations for the external diode channels are shown in [Figure 5.8](#).

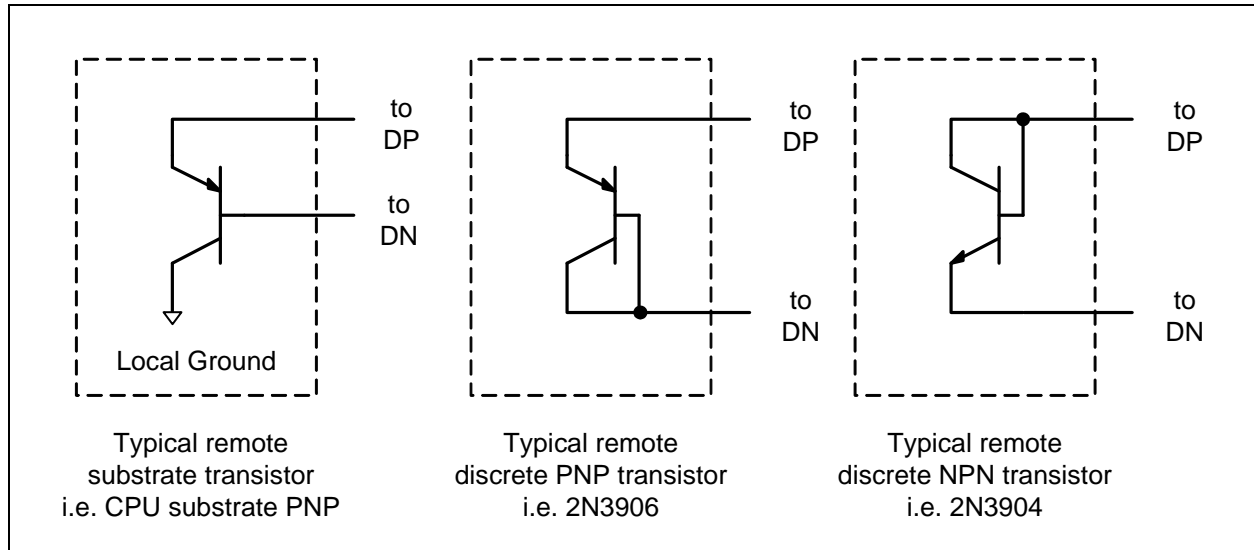

Figure 5.8 Diode Configurations

## Chapter 6 Register Description

The registers shown in [Table 6.1](#) are accessible through the SMBus. An entry of '-' indicates that the bit is not used and will always read '0'.

**Table 6.1 Register Set in Hexadecimal Order**

REGISTER ADDRESS	R/W	REGISTER NAME	FUNCTION	DEFAULT VALUE	PAGE
00h	R	Internal Diode Data High Byte	Stores the integer data for the Internal Diode	00h	Page 31
01h	R	External Diode 1 Data High Byte	Stores the integer data for External Diode 1	00h

## 6.1 Data Read Interlock

When any temperature channel high byte register is read, the corresponding low byte is copied into an internal 'shadow' register. The user is free to read the low byte at any time and be guaranteed that it will correspond to the previously read high byte. Regardless if the low byte is read or not, reading from the same high byte register again will automatically refresh this stored low byte data.

## 6.2 Temperature Data Registers

**Table 6.2 Temperature Data Registers**

ADDR	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
00h	R	Internal Diode High Byte	128	64	32	16	8	4	2	1	00h
29h	R	Internal Diode Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h
01h	R	External Diode 1 High Byte	128	64	32	16	8	4	2	1	00h
10h	R	External Diode 1 Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h
23h	R	External Diode 2 High Byte	128	64	32	16	8	4	2	1	00h
24h	R	External Diode 2 Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h
2Ah	R	External Diode 3 High Byte	128	64	32	16	8	4	2	1	00h
2Bh	R	External Diode 3 Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h

As shown in [Table 6.2](#), all temperatures are stored as an 11-bit value with the high byte representing the integer value and the low byte representing the fractional value left justified to occupy the MSBits.

## 6.3 Status Register

**Table 6.3 Status Register**

ADDR	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
02h	R	Status	BUSY	-	-	HIGH	LOW	FAULT	THERM	HWSD	00h

The Status Register reports general error conditions. To identify specific channels, refer to [Section 6.9](#), [Section 6.16](#), [Section 6.17](#), and [Section 6.18](#). The individual Status Register bits are cleared when the appropriate High Limit, Low Limit, or THERM Limit register has been read or cleared.

**Bit 7 - BUSY** - This bit indicates that the ADC is currently converting. This bit does not cause the ALERT pin to be asserted.

**Bit 4 - HIGH** - This bit is set when any of the temperature channels exceeds its programmed high limit. See the High Limit Status Register for specific channel information ([Section 6.16](#)). When set, this bit will assert the ALERT pin.

**Bit 3 - LOW** - This bit is set when any of the temperature channels drops below its programmed low limit. See the Low Limit Status Register for specific channel information ([Section 6.17](#)). When set, this bit will assert the ALERT pin.

**Bit 2 - FAULT** - This bit is asserted when a diode fault is detected on any of the external diode channels. See the External Diode Fault Register for specific channel information ([Section 6.9](#)). When set, this bit will assert the ALERT pin.

**Bit 1 - THERM** - This bit is set when the any of the temperature channels exceeds its programmed THERM limit. See the THERM Limit Status Register for specific channel information ([Section 6.18](#)).

**Bit 0 - HWSD** - This bit is set when the External Diode 1 Temperature exceeds the Hardware Thermal Shutdown Limit set by the pull-up resistors on the ALERT and SYS\_SHDN pins. When set, this bit will assert the SYS\_SHDN pin.

## 6.4 Configuration Register

**Table 6.4 Configuration Register**

ADDR	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
03h	R/W	Configuration	MASK_ALL	-	ALERT/COMP	-	RECD2	RANGE	DAVG_DIS	-APDD	00h
09h											

The Configuration Register controls the basic operation of the device. This register is fully accessible at either address.

**Bit 7 - MASK\_ALL** - Masks the ALERT pin from asserting.

- '0' (default) - The ALERT pin is not masked. If any of the appropriate status bits are set the ALERT pin will be asserted.
- '1' - The ALERT pin is masked. It will not be asserted for any interrupt condition unless it is configured to act in comparator mode. The Status Registers will be updated normally.

**Bit 5 - ALERT/COMP** - Controls the operation of the ALERT pin.

- '0' (default) - The ALERT pin acts as described in [Section 5.3](#).
- '1' - The ALERT pin acts in comparator mode as described in [Section 5.3.2](#). In this mode the MASK\_ALL bit is ignored.

## Datasheet

Bit 3 - RECD2 - Disables the Resistance Error Correction (REC) for External Diode 2 and External Diode 3.

- '0' (default) - REC is enabled for External Diode 2 and External Diode 3.
- '1' - REC is disabled for External Diode 2 and External Diode 3.

Bit 2 - RANGE - Configures the measurement range and data format of the temperature channels.

- '0' (default) - The temperature measurement range is 0°C to +127.875°C and the data format is binary.
- '1' -The temperature measurement range is -64°C to +191.875°C and the data format is offset binary (see [Table 5.4](#)).

Bit 1 - DAVG\_DIS - Disables the dynamic averaging feature on all temperature channels.

- '0' (default) - The dynamic averaging feature is enabled. All temperature channels will be converted with an averaging factor that is based on the conversion rate as shown in [Table 5.1](#) and [Table 5.2](#).
- '1' - The dynamic averaging feature is disabled. All temperature channels will be converted with a maximum averaging factor of 1x (equivalent to 11-bit conversion). For higher conversion rates, this averaging factor will be reduced as shown in [Table 5.1](#) and [Table 5.2](#).

Bit 0 - APDD (EMC1424 only) - Disables the anti-parallel diode operation. Beta Compensation is disabled on External Diode 2 and 3 regardless of APDD setting. In addition, External Diode 2 Beta Configuration register will be ignored.

- '0' (default) - Anti-parallel diode mode is enabled. Two external diodes will be measured on the DP2 and DN2 pins.
- '1' - Anti-parallel diode mode is disabled. Only one external diode will be measured on the DP2 and DN2 pins.

## 6.5 Conversion Rate Register

Table 6.5 Conversion Rate Register

ADDR	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
04h	R/W	Conversion Rate	-	-	-	-	CONV[3:0]			06h (4/sec)	
0Ah											

The Conversion Rate Register controls how often the temperature measurement channels are updated and compared against the limits. This register is fully accessible at either address.

Bits 3-0 - CONV[3:0] - Determines the conversion rate as shown in [Table 6.6](#).

Table 6.6 Conversion Rate

CONV[3:0]					CONVERSIONS / SECOND
HEX	3	2	1	0	
0h	0	0	0	0	1
1h	0	0	0	1	1
2h	0	0	1	0	1
3h	0	0	1	1	1
4h	0	1	0	0	1

**Table 6.6 Conversion Rate (continued)**

CONV[3:0]					CONVERSIONS / SECOND
HEX	3	2	1	0	
5h	0	1	0	1	2
6h	0	1	1	0	4 (default)
7h	0	1	1	1	8
8h	1	0	0	0	16
9h	1	0	0	1	32
Ah	1	0	1	0	64
Bh - Fh	All others				1

## 6.6 Limit Registers

**Table 6.7 Temperature Limit Registers**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
05h	R/W	Internal Diode High Limit	128	64	32	16	8	4	2	1	55h (85°C)
0Bh											
06h	R/W	Internal Diode Low Limit	128	64	32	16	8	4	2	1	00h (0°C)
0Ch											
07h	R/W	External Diode 1 High Limit High Byte	128	64	32	16	8	4	2	1	55h (85°C)
0Dh											
13h	R/W	External Diode 1 High Limit Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h
08h	R/W	External Diode 1 Low Limit High Byte	128	64	32	16	8	4	2	1	00h (0°C)
0Eh											
14h	R/W	External Diode 1 Low Limit Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h
15h	R/W	External Diode 2 High Limit High Byte	128	64	32	16	8	4	2	1	55h (85°C)
16h	R/W	External Diode 2 Low Limit High Byte	128	64	32	16	8	4	2	1	00h (0°C)

Table 6.7 Temperature Limit Registers (continued)

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
17h	R/W	External Diode 2 High Limit Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h
18h	R/W	External Diode 2 Low Limit Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h
2Ch	R/W	External Diode 3 High Limit High Byte	128	64	32	16	8	4	2	1	55h (85°C)
2Dh	R/W	External Diode 3 Low Limit High Byte	128	64	32	16	8	4	2	1	00h (0°C)
2Eh	R/W	External Diode 3 High Limit Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h
2Fh	R/W	External Diode 3 Low Limit Low Byte	0.5	0.25	0.125	-	-	-	-	-	00h

The device contains both high and low limits for all temperature channels. If the measured temperature exceeds the high limit, then the corresponding status bit is set and the ALERT pin is asserted. Likewise, if the measured temperature is less than or equal to the low limit, the corresponding status bit is set and the ALERT pin is asserted.

The data format for the limits must match the selected data format for the temperature so that if the extended temperature range is used, the limits must be programmed in the extended data format.

The limit registers with multiple addresses are fully accessible at either address.

## 6.7 Scratchpad Registers

Table 6.8 Scratchpad Register

ADDR	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
11h	R/W	Scratchpad	7	6	5	4	3	2	1	0	00h
12h	R/W	Scratchpad	7	6	5	4	3	2	1	0	00h

The Scratchpad Registers are Read Write registers that are used for place holders to be software compatible with legacy programs. Reading from the registers will return what is written to them.

## 6.8 Therm Limit Registers

**Table 6.9 Therm Limit Registers**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
19h	R/W	External Diode 1 THERM Limit	128	64	32	16	8	4	2	1	55h (85°C)
1Ah	R/W	External Diode 2 THERM Limit	128	64	32	16	8	4	2	1	55h (85°C)
20h	R/W	Internal Diode THERM Limit	128	64	32	16	8	4	2	1	55h (85°C)
21h	R/W	THERM Hysteresis	128	64	32	16	8	4	2	1	0Ah (10°C)
30h	R/W	External Diode 3 THERM Limit	128	64	32	16	8	4	2	1	55h (85°C)

The THERM Limit Registers are used to determine whether a critical thermal event has occurred. If the measured temperature exceeds the THERM Limit, then the SYS\_SHDN pin will be asserted (if the corresponding measurement channel is linked to the SYS\_SHDN pin). The limit setting must match the chosen data format of the temperature reading registers.

## 6.9 External Diode Fault Register

**Table 6.10 External Diode Fault Register**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
1Bh	R-C	External Diode Fault	-	-	-	-	E3FLT	E2FLT	E1FLT	-	00h

The External Diode Fault Register indicates which of the external diodes caused the FAULT bit in the Status Register to be set. This register is cleared when it is read.

Bit 3 - E3FLT - This bit is set if the External Diode 3 channel reported a diode fault.

Bit 2 - E2FLT - This bit is set if the External Diode 2 channel reported a diode fault.

Bit 1 - E1FLT - This bit is set if the External Diode 1 channel reported a diode fault.

## 6.10 Software Thermal Shutdown Configuration Register

Table 6.11 Software Thermal Shutdown Configuration Register

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
1Dh	R/W	Software Thermal Shutdown Configuration	-	-	-	-	E3SYS	E2SYS	ESYS	INTSYS	00h

The Software Thermal Shutdown Configuration Register controls whether any of the software channels will assert the  $\overline{\text{SYS\_SHDN}}$  pin. If a channel is enabled, the temperature is compared against the corresponding THERM Limit. If the measured temperature exceeds the THERM Limit, then the  $\overline{\text{SYS\_SHDN}}$  pin is asserted. This functionality is in addition to the Hardware Shutdown circuitry.

Bit 3 - E3SYS - configures the External Diode 3 channel to assert the  $\overline{\text{SYS\_SHDN}}$  pin based on its THERM Limit.

- '0' (default) - the External Diode 3 channel is not linked to the  $\overline{\text{SYS\_SHDN}}$  pin. If the temperature exceeds its THERM Limit, the E3THERM status bit is set but the  $\overline{\text{SYS\_SHDN}}$  pin is not asserted.
- '1' - the External Diode 3 channel is linked to the  $\overline{\text{SYS\_SHDN}}$  pin. If the temperature exceeds its THERM Limit, the E3THERM status bit is set and the  $\overline{\text{SYS\_SHDN}}$  pin is asserted. It will remain asserted until the temperature drops below its THERM Limit minus the THERM Hysteresis.

Bit 2 - E2SYS - configures the External Diode 2 channel to assert the  $\overline{\text{SYS\_SHDN}}$  pin based on its THERM Limit.

- '0' (default) - the External Diode 2 channel is not linked to the  $\overline{\text{SYS\_SHDN}}$  pin. If the temperature exceeds its THERM Limit, the E2THERM status bit is set but the  $\overline{\text{SYS\_SHDN}}$  pin is not asserted.
- '1' - the External Diode 2 channel is linked to the  $\overline{\text{SYS\_SHDN}}$  pin. If the temperature exceeds its THERM Limit, the E2THERM status bit is set and the  $\overline{\text{SYS\_SHDN}}$  pin is asserted. It will remain asserted until the temperature drops below its THERM Limit minus the THERM Hysteresis.

Bit 1 - E1SYS - configures the External Diode 1 channel to assert the  $\overline{\text{SYS\_SHDN}}$  pin based on its THERM Limit.

- '0' (default) - the External Diode 1 channel is not linked to the  $\overline{\text{SYS\_SHDN}}$  pin. If the temperature exceeds its THERM Limit, the E1THERM status bit is set but the  $\overline{\text{SYS\_SHDN}}$  pin is not asserted.
- '1' - the External Diode 1 channel is linked to the  $\overline{\text{SYS\_SHDN}}$  pin. If the temperature exceeds its THERM Limit, the E1THERM status bit is set and the  $\overline{\text{SYS\_SHDN}}$  pin is asserted. It will remain asserted until the temperature drops below its THERM Limit minus the THERM Hysteresis.

Bit 0 - INTSYS - configures the Internal Diode channel to assert the  $\overline{\text{SYS\_SHDN}}$  pin based on its THERM Limit.

- '0' (default) - the Internal Diode channel is not linked to the  $\overline{\text{SYS\_SHDN}}$  pin. If the temperature exceeds its THERM Limit, the ITHERM status bit is set but the  $\overline{\text{SYS\_SHDN}}$  pin is not asserted.
- '1' - the Internal Diode channel is linked to the  $\overline{\text{SYS\_SHDN}}$  pin. If the temperature exceeds its THERM Limit, the ITHERM status bit is set and the  $\overline{\text{SYS\_SHDN}}$  pin is asserted. It will remain asserted until the temperature drops below its THERM Limit minus the THERM Hysteresis.

## 6.11 Hardware Thermal Shutdown Limit Register

**Table 6.12 Hardware Thermal Shutdown Limit Register**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
1Eh	R	Hardware Thermal Shutdown Limit	128	64	32	16	8	4	2	1	N/A

This read only register returns the Hardware Thermal Shutdown Limit selected by the value of the pull-up resistors on the  $\overline{\text{ALERT}}$  and  $\overline{\text{SYS\_SHDN}}$  pins. The data represents the hardware set temperature in °C using the active temperature setting set by the RANGE bit in the Configuration Register. See [Table 6.5](#) for the data format.

When the External Diode 1 Temperature exceeds this limit, the  $\overline{\text{SYS\_SHDN}}$  pin is asserted and will remain asserted until the External Diode 1 Temperature drops below this limit minus 10°C.

## 6.12 Channel Mask Register

**Table 6.13 Channel Mask Register**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
1Fh	R/W	Channel Mask	-	-	-	-	E3 MASK	E2 MASK	E1 MASK	INT MASK	00h

The Channel Mask Register controls individual channel masking. When a channel is masked, the  $\overline{\text{ALERT}}$  pin will not be asserted when the masked channel reads a diode fault or out of limit error. The channel mask does not mask the  $\overline{\text{SYS\_SHDN}}$  pin.

Bit 3 - E3MASK - Masks the  $\overline{\text{ALERT}}$  pin from asserting when the External Diode 3 channel is out of limit or reports a diode fault.

- '0' (default) - The External Diode 3 channel will cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.
- '1' - The External Diode 3 channel will not cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

Bit 2 - E2MASK - Masks the  $\overline{\text{ALERT}}$  pin from asserting when the External Diode 2 channel is out of limit or reports a diode fault.

- '0' (default) - The External Diode 2 channel will cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.
- '1' - The External Diode 2 channel will not cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

Bit 1 - E1MASK - Masks the  $\overline{\text{ALERT}}$  pin from asserting when the External Diode 1 channel is out of limit or reports a diode fault.

- '0' (default) - The External Diode 1 channel will cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.
- '1' - The External Diode 1 channel will not cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

Bit 0 - INTMASK - Masks the  $\overline{\text{ALERT}}$  pin from asserting when the Internal Diode temperature is out of limit.

- '0' (default) - The Internal Diode channel will cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit.

- '1' - The Internal Diode channel will not cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit.

## 6.13 Consecutive ALERT Register

Table 6.14 Consecutive ALERT Register

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
22h	R/W	Consecutive ALERT	TIME OUT	CTHRM[2:0]			CALRT[2:0]			-	70h

The Consecutive ALERT Register determines how many times an out-of-limit error or diode fault must be detected in consecutive measurements before the  $\overline{\text{ALERT}}$  or  $\text{SYS\_SHDN}$  pin is asserted. Additionally, the Consecutive ALERT Register controls the SMBus Timeout functionality.

An out-of-limit condition (i.e. HIGH, LOW, or FAULT) occurring on the same temperature channel in consecutive measurements will increment the consecutive alert counter. The counters will also be reset if no out-of-limit condition or diode fault condition occurs in a consecutive reading.

When the ALERT pin is configured as an interrupt, when the consecutive alert counter reaches its programmed value, the following will occur: the STATUS bit(s) for that channel and the last error condition(s) (i.e. E1HIGH, or E2LOW and/or E2FAULT) will be set to '1', the ALERT pin will be asserted, the consecutive alert counter will be cleared, and measurements will continue.

When the  $\overline{\text{ALERT}}$  pin is configured as a comparator, the consecutive alert counter will ignore diode fault and low limit errors and only increment if the measured temperature exceeds the High Limit. Additionally, once the consecutive alert counter reaches the programmed limit, the ALERT pin will be asserted, but the counter will not be reset. It will remain set until the temperature drops below the High Limit minus the THERM Hysteresis value.

For example, if the CALRT[2:0] bits are set for 4 consecutive alerts on an EMC1423 device, the high limits are set at 70°C, and none of the channels are masked, then the  $\overline{\text{ALERT}}$  pin will be asserted after the following four measurements:

1. Internal Diode reads 71°C and both external diodes read 69°C. Consecutive alert counter for INT is incremented to 1.
2. Both Internal Diode and External Diode 1 read 71°C and External Diode 2 reads 68°C. Consecutive alert counter for INT is incremented to 2 and for EXT1 is set to 1.
3. The External Diode 1 reads 71°C and both the Internal Diode and External Diode 2 read 69°C. Consecutive alert counter for INT and EXT2 are cleared and EXT1 is incremented to 2.
4. The Internal Diode reads 71°C and both external diodes read 71°C. Consecutive alert counter for INT is set to 1, EXT2 is set to 1, and EXT1 is incremented to 3.
5. The Internal Diode reads 71°C and both the external diodes read 71°C. Consecutive alert counter for INT is incremented to 2, EXT2 is set to 2, and EXT1 is incremented to 4. The appropriate status bits are set for EXT1 and the ALERT pin is asserted. EXT1 counter is reset to 0 and all other counters hold the last value until the next temperature measurement.

Bit 7 - TIMEOUT - Determines whether the SMBus Timeout function is enabled.

- '0' (default) - The SMBus Timeout feature is disabled. The SMCLK line can be held low indefinitely without the device resetting its SMBus protocol.
- '1' - The SMBus Timeout feature is enabled. If the SMCLK line is held low for more than 30ms, then the device will reset the SMBus protocol.

Bits 6-4 CTHRM[2:0] - Determines the number of consecutive measurements that must exceed the corresponding THERM Limit and Hardware Thermal Shutdown Limit before the  $\text{SYS\_SHDN}$  pin is asserted. All temperature channels use this value to set the respective counters. The consecutive THERM counter is incremented whenever any of the measurements exceed the corresponding THERM Limit or if the External Diode 1 measurement exceeds the Hardware Thermal Shutdown Limit.

If the temperature drops below the THERM limit or Hardware Thermal Shutdown Limit, then the counter is reset. If the programmed number of consecutive measurements exceed the THERM Limit or Hardware Thermal Shutdown Limit, and the appropriate channel is linked to the SYS\_SHDN pin, then the SYS\_SHDN pin will be asserted low.

Once the  $\overline{\text{SYS\_SHDN}}$  pin is asserted, the consecutive THERM counter will not reset until the corresponding temperature drops below the appropriate limit minus the corresponding hysteresis.

The bits are decoded as shown in Table 6.15. The default setting is 4 consecutive out of limit conversions.

Bits 3-1 - CALRT[2:0] - Determine the number of consecutive measurements that must have an out of limit condition or diode fault before the ALERT pin is asserted. All temperature channels use this value to set the respective counters. The bits are decoded as shown in Table 6.15. The default setting is 1 consecutive out of limit conversion.

**Table 6.15 Consecutive Alert / THERM Settings**

2	1	0	NUMBER OF CONSECUTIVE OUT OF LIMIT MEASUREMENTS
0	0	0	1 (default for CALRT[2:0])
0	0	1	2
0	1	1	3
1	1	1	4 (default for CTHRM[2:0])

## 6.14 Beta Configuration Registers

**Table 6.16 Beta Configuration Registers**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
26h	R/W	External Diode 2 Beta Configuration	-	-	-	-	ENABLE2	BETA2[2:0]			08h for EMC1423 or 07h for EMC1424

This register is used to set the Beta Compensation factor that is used for the external diode channels.

Bit 3 - ENABLEx - Enables the Beta Compensation factor autodetection function. This function shall be disabled for External Diode 2.

- '0' - The Beta Compensation Factor autodetection circuitry is disabled. The External Diode will always use the Beta Compensation factor set by the BETAx[2:0] bits.
- '1' (default) - The Beta Compensation factor autodetection circuitry is enabled. At the beginning of every conversion, the optimal Beta Compensation factor setting will be determined and applied. The BETAx[2:0] bits will be automatically updated to indicate the current setting.

Bit 2-0 - BETAx[2:0] - These bits always reflect the current beta configuration settings. If autodetection circuitry is enabled, then these bits will be updated automatically and writing to these bits will have no effect. If the autodetection circuitry is disabled, then these bits will determine the beta configuration setting that is used for their respective channels.

Care should be taken when setting the BETAx[2:0] bits when the autodetection circuitry is disabled. If the Beta Compensation factor is set at a beta value that is higher than the transistor beta, then the circuit may introduce measurement errors. When measuring a discrete thermal diode (such as

2N3904) or a CPU diode that functions like a discrete thermal diode (such as an AMD processor diode), then the BETAx[2:0] bits should be set to '111b'.

Table 6.17 CPU Beta Values

HEX	ENABLEX	BETAX[2:0]			MINIMUM BETA
		2	1	0	
0h	0	0	0	0	0.11
1h	0	0	0	1	0.18
2h	0	0	1	0	0.25
3h	0	0	1	1	0.33
4h	0	1	0	0	0.43
5h	0	1	0	1	1.00
6h	0	1	1	0	2.33
7h	0	1	1	1	Disabled
8h - Fh	1	X	X	X	Autodetection

## 6.15 External Diode Ideality Factor Registers

Table 6.18 Ideality Configuration Registers

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
28h	R/W	External Diode 2 Ideality Factor	-	-	IDEALITY2[5:0]					12h	
31h	R/W	External Diode 3 Ideality Factor	-	-	IDEALITY3[5:0]					12h	

These registers store the ideality factors that are applied to the external diodes. [Table 6.19](#) defines each setting and the corresponding ideality factor. Beta Compensation and Resistance Error Correction automatically correct for most diode ideality errors, therefore it is not recommended that these settings be updated without consulting SMSC.

Table 6.19 Ideality Factor Look-Up Table (Diode Model)

SETTING	FACTOR	SETTING	FACTOR	SETTING	FACTOR
08h	0.9949	18h	1.0159	28h	1.0371
09h	0.9962	19h	1.0172	29h	1.0384
0Ah	0.9975	1Ah	1.0185	2Ah	1.0397

**Table 6.19 Ideality Factor Look-Up Table (Diode Model) (continued)**

SETTING	FACTOR	SETTING	FACTOR	SETTING	FACTOR
0Bh	0.9988	1Bh	1.0200	2Bh	1.0410
0Ch	1.0001	1Ch	1.0212	2Ch	1.0423
0Dh	1.0014	1Dh	1.0226	2Dh	1.0436
0Eh	1.0027	1Eh	1.0239	2Eh	1.0449
0Fh	1.0040	1Fh	1.0253	2Fh	1.0462
10h	1.0053	20h	1.0267	30h	1.0475
11h	1.0066	21h	1.0280	31h	1.0488
12h	1.0080	22h	1.0293	32h	1.0501
13h	1.0093	23h	1.0306	33h	1.0514
14h	1.0106	24h	1.0319	34h	1.0527
15h	1.0119	25h	1.0332	35h	1.0540
16h	1.0133	26h	1.0345	36h	1.0553
17h	1.0146	27h	1.0358	37h	1.0566

For CPU substrate transistors that require the BJT transistor model, the ideality factor behaves slightly differently than for discrete diode-connected transistors. Refer to [Table 6.20](#) when using a CPU substrate transistor.

**Table 6.20 Substrate Diode Ideality Factor Look-Up Table (BJT Model)**

SETTING	FACTOR	SETTING	FACTOR	SETTING	FACTOR
08h	0.9869	18h	1.0079	28h	1.0291
09h	0.9882	19h	1.0092	29h	1.0304
0Ah	0.9895	1Ah	1.0105	2Ah	1.0317
0Bh	0.9908	1Bh	1.0120	2Bh	1.0330
0Ch	0.9921	1Ch	1.0132	2Ch	1.0343
0Dh	0.9934	1Dh	1.0146	2Dh	1.0356
0Eh	0.9947	1Eh	1.0159	2Eh	1.0369

13h	1.0013	23h	1.0226	33h	1.0434
14h	1.0026	24h	1.0239	34h	1.0447
15h	1.0039	25h	1.0252	35h	1.0460

**Table 6.20 Substrate Diode Ideality Factor Look-Up Table (BJT Model) (continued)**

SETTING	FACTOR	SETTING	FACTOR	SETTING	FACTOR
16h	1.0053	26h	1.0265	36h	1.0473
17h	1.0066	27h	1.0278	37h	1.0486

**APPLICATION NOTE:** When measuring a 65nm Intel CPUs, the Ideality Setting should be the default 12h. When measuring 45nm Intel CPUs, the Ideality Setting should be 15h.

## 6.16 High Limit Status Register

**Table 6.21 High Limit Status Register**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
35h	R-C	High Limit Status	-	-	-	-	E3HIGH	E2HIGH	E1HIGH	IHIGH	00h

The High Limit Status Register contains the status bits that are set when a temperature channel high limit is exceeded. If any of these bits are set, then the HIGH status bit in the Status Register is set. Reading from the High Limit Status Register will clear all bits if. Reading from the register will also clear the HIGH status bit in the Status Register.

The  $\overline{\text{ALERT}}$  pin will be set if the programmed number of consecutive alert counts have been met and any of these status bits are set.

The status bits will remain set until read unless the  $\overline{\text{ALERT}}$  pin is configured as a comparator output (see [Section 5.3.2](#)).

Bit 3 - E3HIGH - This bit is set when the External Diode 3 channel exceeds its programmed high limit.

Bit 2 - E2HIGH - This bit is set when the External Diode 2 channel exceeds its programmed high limit.

Bit 1 - E1HIGH - This bit is set when the External Diode 1 channel exceeds its programmed high limit.

Bit 0 - IHIGH - This bit is set when the Internal Diode channel exceeds its programmed high limit.

## 6.17 Low Limit Status Register

**Table 6.22 Low Limit Status Register**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
36h	R-C	Low Limit Status	-	-	-	-	E3LOW	E2LOW	E1LOW	ILOW	00h

The Low Limit Status Register contains the status bits that are set when a temperature channel drops below the low limit. If any of these bits are set, then the LOW status bit in the Status Register is set. Reading from the Low Limit Status Register will clear all bits. Reading from the register will also clear the LOW status bit in the Status Register.

The  $\overline{\text{ALERT}}$  pin will be set if the programmed number of consecutive alert counts have been met and any of these status bits are set.

The status bits will remain set until read unless the  $\overline{\text{ALERT}}$  pin is configured as a comparator output (see [Section 5.3.2](#)).

Bit 3 - E3LOW - This bit is set when the External Diode 3 channel drops below its programmed low limit.

Bit 2 - E2LOW - This bit is set when the External Diode 2 channel drops below its programmed low limit.

Bit 1 - E1LOW - This bit is set when the External Diode 1 channel drops below its programmed low limit.

Bit 0 - ILOW - This bit is set when the Internal Diode channel drops below its programmed low limit.

## 6.18 THERM Limit Status Register

**Table 6.23 THERM Limit Status Register**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
37h	R-C	THERM Limit Status	-	-	-	-	E3 THERM	E2 THERM	E1 THERM	ITHERM	00h

The THERM Limit Status Register contains the status bits that are set when a temperature channel THERM Limit is exceeded. If any of these bits are set, then the THERM status bit in the Status Register is set. Reading from the THERM Limit Status Register will not clear the status bits. Once the temperature drops below the THERM Limit minus the THERM Hysteresis, the corresponding status bits will be automatically cleared. The THERM bit in the Status Register will be cleared when all individual channel THERM bits are cleared.

Bit 3 - E3THERM - This bit is set when the External Diode 3 channel exceeds its programmed THERM Limit.

Bit 2 - E2THERM - This bit is set when the External Diode 2 channel exceeds its programmed THERM Limit.

Bit 1 - E1THERM - This bit is set when the External Diode 1 channel exceeds its programmed THERM limit.

Bit 0- ITHERM - This bit is set when the Internal Diode channel exceeds its programmed THERM limit.

## 6.19 Filter Control Register

**Table 6.24 Filter Configuration Register**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
40h	R/W	Filter Control	-	-	-	-	-	-	FILTER[1:0]		00h

The Filter Configuration Register controls the digital filter on the External Diode 1 channel.

Bits 1-0 - FILTER[1:0] - Control the level of digital filtering that is applied to the External Diode temperature measurements as shown in [Table 6.25](#). See [Figure 5.5](#) and [Figure 5.6](#) for examples on the filter behavior.

Table 6.25 Filter Settings

FILTER[1:0]		AVERAGING
1	0	
0	0	Disabled (default)
0	1	Level 1
1	0	Level 1
1	1	Level 2

## 6.20 Product ID Register

Table 6.26 Product ID Register

ADDR	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
FDh	R	Product ID	0	0	1	0	0	0	1	1	23h EMC1423
FDh	R	Product ID	0	0	1	0	0	1	1	1	27h EMC1424

The Product ID Register holds a unique value that identifies the device.

## 6.21 SMSC ID Register (FEh)

Table 6.27 Manufacturer ID Register

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
FEh	R	SMSC ID	0	1	0	1	1	1	0	1	5Dh

The Manufacturer ID register contains an 8 bit word that identifies the SMSC as the manufacturer of the EMC1423 and EMC1424.

## 6.22 Revision Register (FFh)

**Table 6.28 Revision Register**

ADDR.	R/W	REGISTER	B7	B6	B5	B4	B3	B2	B1	B0	DEFAULT
FFh	R	Revision	0	0	0	0	0	0	0	1	01h
FFh	R	Revision	0	0	0	0	0	1	0	0	04h

The Revision register contains an 8-bit word that identifies the die revision. It can be 01h or 04h.

**ENGINEERING NOTE:**

## Chapter 7 Typical Operating Curves

# Chapter 8 Package Information

Figure 8.1 10-Pin MSOP / TSSOP Package

## 8.1 Package Markings

All devices will be marked on the first line of the top side with "1423" or "1424". On the second line, they will be marked with the appropriate -X number (-1, -2, etc), the Functional Revision "B" and Country Code (CC).

## Chapter 9 Datasheet Revision History

**Table 9.1 Customer Revision History**

REVISION LEVEL & DATE	SECTION/FIGURE/ENTRY	CORRECTION
Rev. 2.0 (08-10-12)	Table 3.3, "SMBus Electrical Specifications"	Added conditions for $t_{HD:DAT}$ . Data hold time minimum of 0.3 $\mu$ s is required when receiving from the master. Data hold time is 0 $\mu$ s min when transmitting to the master.
	Section 6.22, "Revision Register (FFh)"	Added row to indicate that revision ID can be 04h. Revision ID may be 04h or 01h.
Rev. 1.36 (07-02-09)	Table 2.1, "EMC1423 and EMC1424 Pin Description"	In pin description table, added to function column: "requires pull-up resistor" for SMDATA and SMCLK pins
	Table 2.1, "EMC1423 and EMC1424 Pin Description"	Identified 5V tolerant pins. Added the following application note below table: "For the 5V tolerant pins that <u>have a pull-up resistor</u> (SMCLK, SMDATA, SYS_SHDN, and ALERT), the voltage difference between VDD and the pull-up voltage must never exceed 3.6V."
	Table 3.1, "Absolute Maximum Ratings"	Updated voltage limits for 5V tolerant pins with pull-up resistors.  Added the following note below table: "For the 5V tolerant pins that <u>have a pull-up resistor</u> (SMCLK, SMDATA, SYS_SHDN, and ALERT), the pull-up voltage must not exceed 3.6V when the device is unpowered."
	Table 3.2, "Electrical Specifications"	Added leakage current.
Rev. 1.35 (04-17-09)	Table 3.1, "Absolute Maximum Ratings"	Package thermal characteristics for DFN-10 removed
Rev. 1.34 (02-27-09)	Table 5.4, "Temperature Data Format"	Extended range for -1 updated from 001 1111 1111 to 001 1111 1000
